We organized the Leonids observing network that comprised of 276 observation teams consisting of about 3,000 senior high-school students in Japan on Nov. 17 1998. In 1999, we organized worldwide network by senior high-school students. The network is comprised of 307 teams from 23 countries. The base line of our new project is the Earth size. And, we succeeded in 20 hours incessant observations, depending on the network. One of the observational team of the project in Tanzania, they have encountered leonid meteor storm. We report on the scientific results and the educational aspects from these projects. Details of the projects are seen on our web site (<http://www.leonids.net/>).
