

Ocean as a key for projection of long term climate change

ABE-OUCHI, Ayako^{1*}

¹AORI, University of Tokyo and JAMSTEC

The role of deep sea and polar region is increasing for understanding the ongoing global warming and the better projection of future climate. We will here raise several research examples related to the determination of climate sensitivity, polar amplification, and Atlantic Meridional Overturning Circulation response.

Keywords: ocean, climate, paleoclimate
