Global Map is a basic global geospatial dataset developed through the international cooperation of the national mapping organizations in the world. It consists of eight thematic layers based on the consistent specifications. By combining the Global Map with other useful geospatial information, we can understand the human activities which affects the environment and the current situation of land cover or tree cover. This presentation will introduce the Global Map and the current situation of the world seen through the Global Map.

Keywords: Global Map, Geospatial Information, Global Environment, Land Cover, Percent Tree Cover
