

Anatomy of solar system origin from Itokawa and the family

YURIMOTO, Hisayoshi^{1*}

¹Hokkaido University

Our solar system has been formed about 4.6 billion ago. Materials formed before and during solar system formation are preserved in chondrites which is primitive meteorites. The materials have been found in recent 10 years by new state-of-art instruments. The materials show that very active and very quiet environments are coexisted in the early solar system.
