

The Detection and the Rejection of Outliers

Tsutomu Saito [1]

[1] NASHI

The Detection and the Rejection of Outliers: Theoretically, it is absolutely necessary to detect outliers in the least squares adjustment; in addition, to reject them, if necessary. We have both Baarda and Pope methods for the treatment of the outliers. Since Pope method is more advanced in theory, numerical examples using the method are shown as follows: 1) To confirm the theory. 2) the Construction of Computational Program. 3) Specification of examples. a. Triangulation and Trilateration. b. Traverse. c. Resection. d. Similarity Transformation. e. Three Dimensional Observation incorporated with GPS vectors
