

Low-temperature component of the magnetization in the red cherts at the flank of Kiso River, in Kakamigahara, Gifu pref.

Katumasa Maikuma [1], Hidetoshi Shibuya [1]

[1] Dep't Earth Sci., Kumamoto Univ.

Paleomagnetism of the red cherts on the flank of the Kiso river in Kakamigahara city, Central Japan, was made in special reference to the secondary component. One of the low temperature component was found to postdate all the folding seen in the area, and to predate to the 15Ma-clockwise-rotation of the Southwest Japan.
