

## Recurrence interval of large earthquakes in the northern Japan Sea

# Ken Ikehara [1]

[1] Marine Geol. Dep., Geol. Surv. Japan

Several turbidite layers, which were formed in relation to large earthquakes along the eastern margin of Japan Sea, occurred in deep-sea sediments of northern Japan Sea. Recurrence intervals of these turbidite layers in the Shiribeshi Trough and eastern Japan Basin suggested that those of large earthquakes were thought to be around 1000 years.
