

Current states and proposals of university students who think about earth and space science education of the 21st century

Kunihiro Ryoki[1]

[1] Natural Sci. Kinki PC

The questionnaire research, which is about the learning contents of the science in the high school, was done for the university students. The result of the research, those who learned physics were 30.5 p.c., chemistry 70.9, biology 80.7, and earth and space science 35.4. There are a lot of opinions that knowledge and the action method concerning natural disasters should be learned by the next generation. On the other hand, there are a lot of students who think that there is a cause in the university entrance system as for the decline of the education of earth and space science.
