

Microbial phylogeny in terms of cellular components

Masaharu Ishii[1]

[1] Dep. Biotech., The University of Tokyo

Microorganisms can be divided into Bacteria or Archaea. Some cellular compounds can be found in both groups; while specific compounds are also found in each group.

In my talk, special attention will be paid to the substances which exist within membranes. Total description of common compounds or specific compounds will be performed. Also, biosynthetic pathway will be another focus of my talk so that we can get clear and overall image of cellular components in microorganisms.
