High-temperature high-pressure phase equilibrium experiments of CaMgSi₂O₆ were performed in the pressure range of 17.5 - 21GPa, and the temperature range of 1000 - 1600 C, for 1 - 5 hours, using a 6-8 type multi-anvil apparatus.

It was consequently found that at 18GPa CaMgSi₂O₆(Cpx) transformed to MgSp + CaPv + St up to 1400 C, and transformed to MgGar+CaPv above 1500 C. And the both assemblages transformed to MgIl+CaPv at 21GPa.
