The contribution of cosmogenic isotopes to the understanding of the environmental system

# Hiroyuki Kitagawa[1]
[1] IHAS

The cosmogenic isotopes (eg. C14 and Be10) are important tracers for the investigation of the environmental system on earth. As an example for environmental analysis with the cosmogenic isotope tracers, the past C14 changes during the past 45000 years estimated from the annual laminated sediments of Lake Suigetsu (Fukui Prefecture, Japan) would be presented.
