Recent rapid progress in information technology gives people great possibilities to know the recent intelligence of science and technology. We have started a project to demonstrate digital library system, "Data base of Earth Evolution History" on World Wide Web. Scientists and information engineers join in the project to create an interface between public society and science community. The scientific data should be a public property for not only research used but also education tool. Here we describe the basic idea and concept for making the "Data base of Earth Evolution History", introduce the process of the project, and show some representative displays of the prototypes. We will make efforts to improve it more attractive for many peoples in the future.
