

Martian craters and surface environment

Hirohide Demura[1]

[1] NASDA

Nowadays huge data and results of USA's planetary explorations are put on worldwide view and distributed on the basis of the Planetary Data System. Thus, we have a rich store of knowledge about surface geomorphology and environment on Mars. Here, I give a lecture of review of the current status, results, and aimings of future missions. What type of integrated science can be done is also introduced through an example topic of Martian craters and surface environment.
