Using quarry blasting of Shizuoka Susono, it applied to the Shizuoka eastern part (the Hiratsuka-Susono profile) from the Kanagawa western part, and observation was performed in June, 2000. This observation serves as reverse of explosion (last year autumn Seismological Society of Japan announcement) on January 15, 2000. Moreover, about 15-30km lines was developed in west, north, and the direction of southeast besides this profile. In this report, while the outline of observation is introduced, the feature of the obtained record is reported.
