We propose Solar System Surveyor as a new ground-based facility for the planetary science.

Small bodies of the outer solar system are giving valuable information not only on the large scale, but also the early history of our solar system. Furthermore, recent development of the planetary missions require the supporting observations from the ground-based facilities.

In order to do it, a new project of the Solar System Surveyor, which is 3-m class telescope mainly for survey, has been proposed. In this presentation, we introduce present status of this project together with the brief summary.
