The secular variation of the earth potential observation

Mamoru Yamada[1], Takesi Nakayama[2]

[1] Res. Ctr. Seismol. & Volcanol., Nagoya Univ., [2] none

At 3 observation points in the Omaezaki area, we have been observing the earth potential since 1992. As a secular variation, the data indicate the stable increase with the rate of 10 mV/100m/year. We also observed the short period disturbances in earth potential that showed the good correlation with the seismic ground motion.
