

# Changes of the process of collecting Earthquake waveform data in JMA

# Kouji Gouke[1]

[1] JMA

The Japan Meteorological Agency (JMA) prepared 'Versatile Seismograph' with a focus on Tokai area and Tonaikai-Nankai area as a part of activity of offering 'Nowcast Earthquake Information'. This preparation mainly aimed to make the part of units like telemeter capable and enhance the network device to allow the several types of data is able to be transferred..

In this discussion, we report the new process of collecting data such as earthquake waveform since its process was changed. Especially we'd like to introduce the function of collecting data which is stable and timely since we have emergency operation like Tsunami forecast that is being delay of data collection is unacceptable.
