The MU (Middle and Upper atmosphere radar) was established in 1984, and has been used by domestic and international researchers as a collaborative research facility. Numerous achievements in the fields of aeronomy, middle atmosphere science, meteorology, communication engineering, space engineering, earth and planetary science, and astronomy have been attained with this radar. On the other hand, quite a few young researchers have used the MU radar for their PhD studies and now continue their researches as

outstanding scientists. In this presentation, some of these researchers will give short comments on the MU radar in future.
