

How Pro.Takeuchi grew young students?

Kei Kurita[1]

[1] ERI,Univ. of Tokyo

In recent years several serious problems are discussed in the occasion when young students select their research subject. They seem to hesitate to make a first step in the research while they spend much time in exploring the subjects. This partly reflects the fact that the frontier of the science advances further beyond the scope of the young students who just start their research. This situation makes them difficult to sense advanced subjects as their own subject. I would like to make several suggestions on this point based on my experience with Prof. H.Takeuchi. He is famous for stimulating students and making them excited in their research.
