I perform monitoring of an electromagnetism phenomenon to go ahead of an earthquake from 1996 for the purpose of finding the means that is effective for a short-term earthquake prediction in Gyotoku Senior High School natural science club.

The establishment of observation point in seismic center neighborhood is necessary to examine it about the electromagnetic wave. We paid attention to water level and a radio tele meter of precipitation observation point which Ministry of Land, Infrastructure and Transport installed along a national river. I developed a movement observation system of the in-vehicle model that we moved to an area of electric wave abnormality quickly this time, and could start observation. This report is the result that carried out observation to move the Lake Inawashiro-ko outskirts as a target on August 10, 2006.
