Numerical code inter-comparison for CO2 storage into aquifers

# Mituhiko Sugihara[1]; Toshiyuki Tosha[2]; Tsuneo Ishido[3]

A code inter-comparison study was carried out for testing and demonstration of numerical simulators which are applicable to performance prediction of CO2 storage into aquifers. We have developed relatively simple test problems, including axi-symmetrical aquifer model the temperature of which is different from that of injected CO2. The calculated results by using four independently-developed simulators will be presented.
