Scientific Mars Mission in Japanese

Sho Sasaki[1]

[1] Mizusawa Obs., Nat'l Astron. Obs. Japan

JAXA is planning a new framework for future space missions. In this category, exploration, the main target is the moon but Mars is also a feasible target. US and Europe are undertaking various Mars missions in decades. Nearly all of missions are aiming at existence of past or present water and the origin of Martian life. However, there are plenty of science targets on Mars where we will be able to produce much contribution. The surface exploration of active Mars or investigation of Martian interior should be also important scientific target.
