In last year's JGU etc., we made the tidal wave disaster prevention pamphlet and the poster for the child in Indonesia and announced the preparation for distributing it.

It reports on the result afterwards in this research. We brought the pamphlets in June, and distributed it directly in a part of village. Moreover, we did the following method as a method of the distribution to the whole country. The explanation and the distribution were done to the representative of each branch in the national athletic meeting of the boy scouts. This pamphlet was distributed in two elementary schools that had existed in the coast in the Nabire city (Papua province) in Indonesia last December. Moreover, Dicky Muslimm taught it by using it in these two elementary schools. This distribution became the first attempt in Indonesia it was not so far that the printed matter of the pamphlet etc. was distributed to each child.

However, TSUNAMI was generated in the southern part of the Java island at the beginning of July. All members survived in the village where the pamphlet and the poster had been distributed before that.

Moreover, TSUNAMI disaster prevention pamphlet (picture book form that pop up) for Japanese children was made. The class that used this was executed by Mr. Ota in the elementary school in Wakayama Prefecture in June and November. As a result, we obtained the feeling that this pamphlet is effective to the school child.
