We know only one example of habitable planet, and only two examples of non-habitable planet but made from similar materials. From these small number of examples, the issue is to have a vivid imagination to abstract characteristics to be focused which identify habitable planets and to clarify their particularity and universality. By the use of the materials presented in this session and with the participation of the audience, we will trace our perception about the present state of affairs and consider the problems to be pursue in the near future.
