Several dynamite explosions were performed along the E-W survey line from Kyoto to Gifu under the DAIDAITOKU project on OCT 16, 2006. We observed these explosions along another NNE-SSW trending survey line from Kameoka to Minoo to investigate the deep seismic reflector beneath the Tamba Plateau. Total 100 temporal stations were installed along the 30km long survey line. We can see evident later phases in the seismic records.
