

Responses for the exhibition program of 'Bubble growth in a cupcake'

Miwa Kuri[1]

[1] Tohoku Univ.

We introduce responses for the exhibition program of 'Bubble formation and growth in pumice'. This program has a purpose of the understanding for the vesiculation process of pyroclastic materials.

We have some restriction on experimental equipments. Some problem carries rather than many possibilities for the learning for science. Single result carries weak impression, on other side the various result carry deep impression and much consideration by the explanation some causes on wrong process.

The simple analogue experiments provides the opportunity of the try-and-error way.
