

The Mass-media and Global Climate Change

Yasunari Kaneko[1]

[1] Mainichi Shinbun Co.Ltd.

First, some of the mass communications (mass-media) are strange. The global warming problem is taken up as an example.

IPCC did not conclude that the average temperature rises 6° C because of the fossil fuel in the 21st century. It only stated that the temperature will possibly rise by 2.0° C to 4.5° C. It only took up 6 models and just discussed possibilities. It is obvious that the calculation prediction of this kind is not based on the model that takes in all the important processes of the real complicated climate. The supercomputer myth seems to be abused. In particular the model predicts the 21st century ignoring the parameters that influence the amount of cloud, which have a significant influence on the calculation result.

It is strange to believe that the CO₂ molecule that annually increases only 1-2 ppm (only 1-2/1,000,000!) is the main molecule that influences the temperature of the atmosphere. The IPCC report only discussed a possibility, but mass communication did become totalitarians (All main newspapers faced to the same direction.) and asserted that man-made CO₂ is the main origin of the global warming. The national bureaucrats and politicians trusted it 200 %, and use a huge amount of national taxes for foreign countries to buy a carbon discharge frame.

In this paper, we touch to focus why the mismatch was born, and discuss about the role of the mass communication of such importance for the future mankind.
