

Various water planets

Yutaka Abe[1]

[1] Earth Planetary Sci., Univ. Tokyo

We conventionally refer to the existence of liquid water as a proxy condition, because terrestrial-life requires liquid water during at least some periods of their life. In our solar system, only the Earth keeps abundant liquid water on its surface. However, some other planets seem to have chances to be water planets. Also, water planets not like earth are theoretically possible. Consideration of such potential water planets will shed light on understanding real water planets.
