

Transformation of population structure in Tokyo metropolitan area- From 1980 to 2000 -

Yusuke Hayashi[1]

[1] Spatial informational science, Tsukuba Univ.

This research clears the change of population structure of Tokyo metropolitan area from 1980 extending through 2000. It analyze that population constitution every of 5 ages of each cities,wards,towns and villages by to similar type it keeps converting from cluster analysis and factor analysis. As a result,It cleared that 1 population structure of Tokyo metropolitan area has done the concentric circular structure which centers the city center. 2 Population structure of area of portion of Chiba prefecture has converted to youth type.

3 at north Kanto the aging is advanced. There,the aging is seen even at the city where have central characteristic is higher.4 IN down town of Tokyo whose young population is high relatively advancing age is advanced. Deviation of population structure is a possibility the socially and economically of producing big effect for community,So a smaller area,development of further research is desired.
