

## Occurrence of Earthquake-induced large-scale landslide dams in Shikoku

# Shuichi Hasegawa[1]

[1] Construction Eng., Kagawa Univ.

This paper describes the characteristics of large-scale landslide dams in Shikoku, with special reference to the Holocene movement of the Median Tectonic Line (MTL). Four landslides in Saijo was formed about two thousands years ago. This landslide age is correlative to the age of the paleo-earthquake triggered by the MTL Other Landslide dams in Shikoku Mountains might have been triggered by the paleo-earthquake triggered by the MTL, but further investigation is necessary for confirmation.
