The Inter-university Upper atmosphere Global Observation NETwork (IUGONET) is a six-year research project by 5 national institutes/universities to build a metadata database of ground-based observations of the upper atmosphere. From the beginning of the project, we have been operating mailing list, wiki, video conference system and web conference system to discuss project management and geoscience research. Recently, we are paying attention to the social media as one of the channels to discuss the geoscience research.

In this presentation, we introduce the case example of the collaboration between the IUGONET project and social media.

Keywords: Upper Atmospheric Research, Social Media, Metadata, Database
