In order to understand generation mechanisms of day-to-day Sq current variations for space weather study, we tried to visualize (1) daily Sq equivalent currents estimated by MAGDAS/210 MM data, (2) daily Sq patterns obtained by the empirical model (Yamazaki et al., 2010), and (3) the subtraction of (1) - (2), i.e. the daily disturbance driven by changes in the solar wind and atmospheric neutral wind.

The daily Sq currents from 4 January to 31 December 2008, were obtained from magnetic data at 16 stations of MAGDAS/CPMN project, Space Environment Research Center, Kyushu University. In the present paper, we investigated the relationship between the interplanetary electric field (i.e.  $E_y = -V_{sw} \times B_z$ (IMF)) and (3) the subtracted Sq currents in the magnetic equatorial region.

It is found that about 20% of 363 days the subtracted Sq currents at the magnetic equator showed a good correlation with the interplanetary magnetic field (IMF), i.e. the eastward EEJ was enhanced during the negative IMF Bz component, while the westward EEJ appeared during the positive IMF Bz component. On the other hand, 66% of 363 days we could not find a good relation between the subtracted Sq current near the dip equator and the IMF Bz variations, indicating the possibility of a coupling mechanism with the atmospheric neutral wind.

We acknowledge Mr Takashi Nosakon(Ashibetsu;ASB),Prof.Shoichi Okano(Onagawa;ONW),Mr Kenichi Isami(Amami;AMA), prof.Tiger Liu(Hualien;HLN),Dr Roland Otadoy(Cebu;CEB),Mr Suhardjono(Manado;MND & Kupang;KPG),Ms Clara Yagini(Pare Pare;PRP),Dr Robert Eager(Darwin;DAW),Dr R.Marshall(Cooktown;CKT & Townville;TWV & Camden;CMD),

Prof.Mcphail(Rockhampton;ROC),Dr N.Prestage(Culgoora;CGR),and Mr Willmott(Melbourne;MLB) for supporting MAGDAS project.
