The social concern with the global environment issues and natural disasters has been growing. At our school, Earth Science Club activities were started five years ago. At first, the club's main activity was going to holiday excursions. In addition to it, research and study on water regime (in particular, groundwater) with a focus on field work have been made during the past few years. These activities have been conducted with the assistance of Project for Enlivenment of Science Clubs in Schools, Japan Science and technology Agency (JST). In this presentation I would like to introduce these activities.
