The Physical-geography of Tsunami Disaster based on Tsunami Sediments Research is strongly expected to be established.

Through the investigation on tsunami sediments the magnitude and the frequency of gigantic tsunami since last 6000 years must be examined along the whole coast of JapanTrench and Kuril Trench. For such an examination, we should observe more precisely, more carefully the behavior of 2011,3.11 Tohoku Tsunami from the view of Physical Geography / Geomorphology.
